SKILLS

Full Stack	React.js, TypeScript, Next.js, Tailwind CSS, Node.js, Java Spring, Python
Database	PostgreSQL
Infra & Cloud	AWS (EC2, Auto Scaling, Load Balancer, RDS), Docker, Supabase, Vercel, Microservices
Mobile	SwiftUI, Flutter, Kotlin
Testing & Quality	Cypress, Playwright, node.js, CI/CD-minded workflows
Teamwork	Git, JIRA, kanban

WORK EXPERIENCE

Full Stack Developer – Bluerate

Jul 2024 - Feb 2026

- Designed and built our website and ERP system end-to-end, owning both frontend (React) and backend (Supabase), from initial architecture through to production.
- Built custom order and messaging modules from scratch to meet evolving business needs, working directly with stakeholders to scope and ship each feature.
- Utilized frontier technology such as Vercel and Supabase for quick iteration and easy deployment. Integrated the CI/CD and database design on Supabase.
- Working with external team to scale and fixing the existing defects, negotiating between the dev and stakeholders to narrow down the requirements and manual quality test before publishing.

Intern Frontend Developer – Miro

Jan 2025 - June 2025

- Implemented responsive, production UI using TypeScript and Tailwind CSS from design specs.
- Organized project timelines and managed the Git repository for the team.
- Worked directly with clients to clarify requirements and shipped successfully to production.

Compliance Quality Assurance – Bybit

Nov 2025 - Aug 2026

- Developed and maintained UI & API **automation tests** for web and mobile applications, including core service module, achieving trustworthy automation test (over 97% passing rate) and improving regression testing efficiency by 40%.
- Owned the quality for internal **ERP** system and **compliance** module (KYC / KYB / AML / Travel Rule / Transaction monitoring / Tax reporting), including maintain daily routine inspection automation test, new features quality assurance.
- Designed and executed test plans based on product requirement PRDs, documenting test plans and execution records to support release readiness.
- Designed and owned UAT and procedural test before new project launching. Find and close all the defects with development team.
- Worked with external stakeholders to identify the compliance gap based on US regulation. Translate BRD into actionable PRD and test plans.
- Executed comprehensive test coverage across functional, integration, and regression scenarios, including database-level consistency checks, middleware (Redis, Kafka), and third-party integrations (tax identity verification, AML/screening providers).
- Built AI-assisted skills to automatically diagnose UI automation test failures and trigger reruns, and turned QA workflows into reusable skills adopted across the team, reducing manual triage time.

PROJECTS

Cafe App

A cafe web application deployed with AWS EC2, Auto Scaling Group, and Load Balancer to achieve high availability. Used a Bastion Host to restrict direct access to EC2 instances, multiple availability zones for resilience, and RDS provisioned via CloudFormation (YAML) for a reproducible architecture.

Strong Compute

[website](#)

Benchmarked the performance and usability of Ray, Lightning, SkyPilot, and Strong Compute’s private distributed framework, using Mask R-CNN and COCO as the benchmark model/dataset. Integrated Ray into the distributed system, improving training speed by up to 36% across 12 GPUs on 2 Strong Compute nodes. Led and supported the team through literature review, troubleshooting, and technical problem-solving.

Honors Research

Researched and benchmarked the feasibility of deploying a CNN model to IoT devices for malicious activity detection. Developed a method to transform network traffic data into grayscale image data, and found that a 2D-CNN model on this representation gave the best balance of accuracy and speed.

EDUCATION

2020 - 2024 Bachelor’s Degree (Honors) at **University of Sydney** (WAM: 81/100)
